Tecplot Data Format (TDF) Guide for 2016 Category:3D computer graphics Category:Technical communication tools Category:Visualization (graphics) Category:Computer-aided design software Category:Scientific simulation softwareQ: How to find the difference of values using java.util.stream.IntStream I would like to find the difference of values in a list of integers using IntStream. For example, I have the following list of integers: 3 5 2 2 2 and I would like to get a list of numbers that have been subtracted from each other so that it gives the following result: 3 2 1 IntStream.range does not help me since it only returns the values 0,1,2. Is there a way to do this using a stream method? A: Your problem seems to be solved by the following code: List list = Arrays.asList(3, 5, 2, 2, 2); IntStream.range(0, list.size()-1).forEachOrdered(i -> list.get(i) - list.get(i+1)); This takes the original list, iterates through it, and subtracts the previous element from the next element. A: I've just posted this as a solution in case somebody is searching for the IntStream equivalent of counting while: List list = Arrays.asList(3, 5, 2, 2, 2); list.stream().skip(1).filter(i -> i > 0).count().forEach(System.out::println); A: Or if you want to do it in a clean way (without streams and all) you can use recursion: static void subtract(List list, int from, int to) { if (to <= 0) return; System.out.println(list.get(to) - list.get(from)); subtract(list, from, to-1); } (to 2492ce491b)
