MaxMem is a simple application which provides a graphical user interface for the automatic freeing of RAM. The intuitive and easy-to-use user interface provides clear information on the status of the RAM. It is easy to set up the different programs you want to start at certain memory levels. The available memory levels can be configured to zero or 100% of the total RAM. They are, in short, a menu where users have the option to choose what to delete from their hard drive. While Windows does a fairly good job at managing memory as far as it goes, the time when that memory is freed up is quite random and unplanned. Right-click the Start button in the Start Menu to get started. 1 Selecting the Start Menu. The left half of the screen shows the categories of the start menu while the right half shows the items in each category. Windows usually does a fairly good job in freeing up memory when it comes to essential functions like Internet Explorer or the Windows media player. However, when it comes to the large numbers of programs that come bundled with Windows (or purchased from third-party software stores), the memory management tools in Windows are poor. At the very least users should be able to clear out the temporary files that Windows creates. It's a simple process that can be done in the control panel's Disk Cleanup application. This tool does its job in a fairly clean fashion, freeing up space that was simply not needed. However, it is prone to errors, which is to be expected in an application that does such a dirty job as this. You may want to use this tool if you can tell when it is safe to do so.
